

Investor-Preview Demo — Publishing Walkthrough

Audience: you (the founder), publishing a safe, sample-data version of the ATANDA Command Centre for investor viewing — before any go-live deploy with real billing.

What investors will see: the existing landing page, a clear yellow **INVESTOR PREVIEW** banner across every screen, and one obvious CTA — **TAKE THE 7-STAGE TOUR** — leading to the </demo> page (an 802-line, fully scripted walkthrough of F1 !' F7 with pre-baked dummy data, JCSE pillar progression, badges, and the ATLAS / SPARTAN certification beats). Sign-up and Sign-in routes are hidden from the top nav, so investors physically cannot create an account or hit a paywall.

What "demo mode" actually does

When the build env `VITE_DEMO_MODE=true` is set, **at build time** the SPA flips three switches:

Switch	Behaviour
Landing CTA	Primary button becomes TAKE THE 7-STAGE TOUR !' /demo (was: INITIATE SESSION !' /sign-up). Secondary button becomes VIEW PRICING .
Top nav (signed-out)	"Sign In" link + "INITIATE" button are removed and replaced with a single VIEW DEMO button. Mobile sheet matches.
Home redirect	<code>`/`</code> always renders <code>`Landing`</code> (no auth-state branch). Direct visits to <code>`/command`</code> , <code>`/sessions`</code> , <code>`/ingest`</code> still ask for auth — investors won't land there from any UI path.
Persistent banner	Yellow INVESTOR PREVIEW — sample data, no live billing, no real accounts** strip is rendered above every route, with a "Take the 7-stage tour !" link.

`BILLING_ENABLED` (in `src/lib/billing-flag.ts`) stays `false` for the investor cut, so the pricing page's CTAs already fall back to `mailto:` access requests — investors cannot accidentally trigger a live Stripe Checkout.

No backend changes. No new tables. The api-server doesn't need to be reachable for the investor experience because the </demo> page renders entirely from local component state — but it's still running so the rest of the surface (pricing copy, exemplars) works the moment you want to show it.

Before you publish — one-time setup checklist

- `[]` Set ``ACCESS_REQUEST_EMAIL`` in `artifacts/command-centre/src/lib/billing-flag.ts` to a real intake address (currently `access@atanda.example`). Any investor who clicks a pricing CTA will hit `mailto:` with that address pre-filled.

- [] Confirm `BILLING_ENABLED = false` in the same file (it is, by default).
- [] Confirm `VITE_CLERK_PUBLISHABLE_KEY` is set (auto-provisioned; required even in demo mode because the Clerk provider stays loaded in the background).
- [] You do **not** need `STRIPE_SECRET_KEY`, `STRIPE_WEBHOOK_SECRET`, or any `STRIPE_PRICE_*` env for the investor preview. Leave them unset.

Publishing the investor preview ("H 90 seconds)

1. **Open the Deploy panel** in the Replit workspace (rocket icon in the sidebar, or click the deploy suggestion card in chat).
2. **Choose `Autoscale`.** It scales to zero between investor visits, so there is no idle cost between demos.
3. **Add one secret to the deploy config:** - Key: `VITE_DEMO_MODE` - Value: `true` (This is a Vite build-time env. The deploy build step picks it up and bakes the demo behaviour into the bundle.)
4. ***Leave all `STRIPE` envs blank** for this deploy. Keep:** - `DATABASE_URL (auto)` - `CLERK_SECRET_KEY`, `CLERK_PUBLISHABLE_KEY`, `VITE_CLERK_PUBLISHABLE_KEY (auto)` - **Optional:** `ADMIN_EMAILS` set to your own email - **Optional:** `SENTRY_DSN` / `VITE_SENTRY_DSN` if you want crash telemetry from the preview
5. **Click Deploy.** Wait ~60 seconds for the build to finish.
6. **Copy the URL** Replit hands you — it will look like `https://<your-app>.replit.app`. That's the investor link.

What to send investors

""Here's a private preview of the ATANDA Command Centre — `https://<your-app>.replit.app`. Click 'Take the 7-stage tour' on the landing page for the full F1 !' F7 walkthrough; the banner makes it clear this is sample data.""

That's it. No login. No setup on their side. Mobile-friendly.

Demo entry points (what to point investors at)

URL	What it shows
<code>`/`</code>	Landing with demo CTA + investor-preview banner
<code>`/demo`</code>	The 7-stage scripted tour: F1 diagnose !' F2 atomic prompt !' F3 CELL MA !' F4 micro PDD !' F5 SPC !' F6 ATLAS PDD !' F7 SPARTAN MVP-PDD, with JCSE pillar progression + quest badges unlocking inline
<code>`/pricing`</code>	All four pricing surfaces, including the **\$199.99 / project** standalone Ingestion card. CTAs route to your <code>`mailto:`</code> intake.
<code>`/exemplars`</code>	Public catalogue — no auth required, useful for "here's what real outputs look like"

`/verify/PWDD-ATANDA-001`

Public certificate verification endpoint — drop a sample cert id to show the audit-trail story

Going live with real billing (after investor cycle)

When you're ready to flip the switch from preview to production:

1. **Edit** ``artifacts/command-centre/src/lib/billing-flag.ts``: change `BILLING_ENABLED` from `false` to `true`. Commit.
2. **In the Deploy panel, change one secret**: set `VITE_DEMO_MODE` to `false` (or delete the secret entirely).
3. **Add all production Stripe secrets**: - `STRIPE_SECRET_KEY` (live mode key) - `STRIPE_WEBHOOK_SECRET` (matching the webhook you'll register in Stripe Dashboard) - `STRIPE_PRICE_PRACTITIONER_MONTHLY`, `STRIPE_PRICE_PRACTITIONER_YEARLY` - `STRIPE_PRICE_ARCHITECT_MONTHLY`, `STRIPE_PRICE_ARCHITECT_YEARLY` - `STRIPE_PRICE_INGESTION_PROJECT`` — point at a **\$199.99 one-time** price id you've created in Stripe for the per-project Ingestion credit
4. **Register the Stripe webhook** in the Stripe Dashboard !' Developers !' Webhooks !' endpoint URL `https://<your-app>.replit.app/api/webhooks/stripe`. Copy the signing secret into `STRIPE_WEBHOOK_SECRET`.
5. **Optional but recommended for transactional email**: `RESEND_API_KEY` + `EMAIL_FROM`.
6. **Click Deploy again**. Same URL, live billing on, demo banner gone, sign-in restored.

Rollback / dry-run safeguards

- The investor preview and the go-live cut **share the same URL**, so investor bookmarks keep working post-launch.
- If you ever need to drop investors back into the preview during go-live (e.g. for a press demo), just toggle `VITE_DEMO_MODE` back to `true` in the deploy config and redeploy. The bundle rebuilds with all demo behaviour restored in ~60 seconds.
- Every Replit checkpoint is a clean rollback target; the last green checkpoints with all of this wired are listed in your chat sidebar.

Verifying the preview looks right (60-second self-check before you send the link)

Visit your `https://<your-app>.replit.app` URL and confirm:

- [] Yellow **INVESTOR PREVIEW** banner across the top of every page
- [] Landing primary CTA reads **TAKE THE 7-STAGE TOUR**, not **INITIATE SESSION**
- [] Top-right shows **VIEW DEMO** — no "Sign In", no "INITIATE"
- [] `/demo` loads and lets you click through all 7 stages without errors
- [] `/pricing` shows four tiers (Explorer / Practitioner / Architect + the **\$199.99 / project** standalone Ingestion card) and CTAs open a `mailto:` window pointed at your `ACCESS_REQUEST_EMAIL`

[] Trying to type `/command` in the URL bar redirects you to the Clerk sign-in screen (proves the real product is protected, the preview is sample-only)

If any of those fail, the most likely cause is that `VITE_DEMO_MODE=true` didn't make it into the build env — check the deploy config and redeploy.
