Date / Time Stamp 03 September 2026

Document Status Tier 0 --- JCSE 43/50 baseline carried
from v2.1.1, not re-scored this pass (see §1.1); Not Yet
HIVE-Certified (Honesty Gate G3)

Governance GRO LIFE MODE · Royal DNA Protocol (ANT
KING + ANT QUEEN) · Honesty Gate G3

FORGE Pipeline Stage Stage 2 --- Definition
(methodology/structure specification pass, not a
certification)

FORGE Execution Record JNGL-FORGE-ATLAS360-2026-
005 (this pass --- F1 diagnosis only; see §1.1)

Section 1 --- Honesty Gate (G3)

Disclosure

This document integrates ALBERT (IP Registration
Intelligence SPC) into ATLAS 360 PLAN as the tenth
additional contributing SPC and is produced as a single
specification pass, per standing Junglenomics practice
for feature-upgrade specifications. The following

disclosures apply and must be carried forward unmodified into any derivative document.

1.1 Build & Certification Status

ATLAS 360 PLAN has not executed through the F1--F9.5 FORGE pipeline as a build target. This document --- including the ALBERT integration added in this pass --- is a methodology and structure specification, not a certification.

The JCSE score for ATLAS 360 PLAN remains not yet assigned at Ultra tier. The card's own conservative dimension-level baseline from the v2.1.1 pass (43/50) is carried forward unchanged; this pass is a feature upgrade only, consistent with how the v2.0.0 (SKRIBE + CARTER + OSIRIS) and v2.1.0 (Dev Kit + Cheat Sheet + Atomic Task Layer) upgrades were handled --- JCSE re-scoring is deferred to a dedicated Fix Engine / F1 pass rather than self-assigned in the same pass that adds the feature (G3-D1).

FORGE Stage for this version remains Stage 2 --- Definition, not Deployed. FORGE Execution Record JNGL-FORGE-ATLAS360-2026-005 logs this pass as an F1-diagnosis-only record: the diagnosis findings in §1.6 below were surfaced and fixed in this same pass (consistent with the precedent set at v2.1.1), but no JCSE re-score, SOLVA GAUNTLET re-adjudication, or MATHMON pass was run. F5 (JCSE ≥ 45) and F7 (FORGE VERIFIED: JCSE ≥ 45 AND MATHMON ≥ 70) both remain open against this card.

1.2 KONSA --- Certification Status (Carried Forward, Unchanged)

KONSA is a certified card: KONSA SPC --- Public Evidence Synthesis Engine, Production ID JNGL-SPC-KONSA-2026-001, JCSE 46/50 (Platinum), FORGE Certified --- SPARTAN MVP, version 1.0 dated 9 August 2026. SOLVA's own adjudication of KONSA returned a Verdict of CONDITIONALLY VIABLE, SVS 68/100 --- not VIABLE --- with the disclosed gap that Consensus.app has no confirmed, licensed programmatic access path for Koncentric Labs, so that layer is DESIGN-INTENT rather than built-and-live. Any ATLAS 360 PLAN PDD citing a KONSA output must carry this dependency disclosure forward.

1.3 KONSTRUCT --- Inherited Disclosure (Carried Forward, Unchanged)

KONSTRUCT enters this synthesis at Tier 0 status per its own founding specification: self-assigned JCSE of 47/50 at the card header, but a conservative dimension-by-dimension total of 39/50 per its own Section 11 audit. ATLAS 360 PLAN treats 39/50 as the trustworthy figure for KONSTRUCT's contribution until KONSTRUCT is independently certified.

1.4 Rename Disclosure (v2.1.1, Carried Forward, Unchanged)

This card was named ATLAS 360 through v2.1.0 and was renamed ATLAS 360 PLAN as of v2.1.1. The Production ID (JNGL-SPC-ATLAS360-2026-001) is deliberately not changed. Prior FORGE Execution Records (-001 through -004) are historical documents and are not retroactively edited to the new name.

1.5 ALBERT Integration Disclosure (New, v3.0.0)

- **[NEW]** ALBERT is added as a contributing SPC and its own founding specification (JNGL-SPC-ALBERT-2026-001, JCSE 46/50, FORGE Certified --- Gold, pending 90-day live-audit confirmation) is not modified by this integration --- only referenced and bound into a new Part 9 / Section 9.
- Does not claim Part 9 (IP Pre-Registration Screening) has been run against a live, produced PDD. This integration is DESIGN-INTENT / specification-only at this pass, exactly as SKRIBE's and CARTER's integrations were at v2.0.0 before their own first live pass.
- Does not claim ALBERT's own live-register validation loop is closed. ALBERT's own Section 11 discloses no live production data exists yet against real USPTO/EUIPO/WIPO/UKIPO/US Copyright Office endpoints in a monitored deployment --- the same OSIRIS-closed-loop class of dependency logged elsewhere in this corpus, and it is not closed by this integration.

- Does not claim that a Part 9 IP Pre-Registration Screening finding is a clearance, a legal opinion, or a substitute for attorney or registered-agent review, under any framing — ALBERT's own non-advisory boundary (its §9 Constraint Set) is inherited into Part 9 unmodified, not loosened by virtue of being embedded in a PDD.
- Does not claim ATLAS 360 PLAN or any SPC in its roster is a law firm, a Registered Patent Agent, or a filing agent of record.

1.6 What This Document Does Not Claim (Updated)

- Does not claim ATLAS 360 PLAN has been used to produce a live PDD.
- Does not claim regulatory sign-off; Section 6 states a compliance-checking framework, not a legal certification.
- Does not claim KONSTRUCT or the fused ATLAS 360 PLAN card are HIVE MATRIX LABS certified. KONSAs are FORGE Certified (SPARTAN MVP tier) but carries its own disclosed CONDITIONALLY VIABLE verdict — see §1.2.
- **[NEW]** F1 diagnosis finding, this pass: the source card carried a silent Section-numbering discontinuity — Section 14 was referenced nowhere and never existed between the v2.0.0 renumbering (7--11 → 9,

11, 12, 13, 14) and the v2.1.1 pass, meaning the intended Section 14 slot was never actually occupied. This pass closes that gap by design (see renumbering table, §1.7), rather than leaving it undisclosed a second time.

1.7 Section Renumbering Table (This Pass)

A new Section 9 (ALBERT Layer) is inserted after the existing Section 8 (CARTER Terminology Library), consistent with the precedent set by Sections 7 and 8 themselves --- each prior new contributing SPC received its own numbered section at the point it joined the council. This shifts five subsequent sections by one and, in doing so, absorbs the undisclosed Section 14 gap identified in §1.6.

v2.1.1 Section v3.0.0 Section Title Change

9 10 Deployment Modes Renumbered, content unchanged

10 11 Living PDD Engine: OSIRIS + CODE DJ
Renumbered, content unchanged

11 12 Constraints & Containment Triggers Renumbered,
ALBERT constraints added

12 13 ATLAS 360 PLAN Test Suite Renumbered, STT-
14/15 added

13 14 Worked Example: Live KONSA Evidence Pass
Renumbered --- now correctly occupies the previously-
empty Section 14 slot

(none) 9 IP Pre-Registration Screening: ALBERT Layer
New

15--18 15--18 Dev Kit / Cheat Sheet / Atomic Task Layer / Version History Unchanged

Section 2 --- Card Identity & Metadata

Card Name ATLAS 360 PLAN (Automated Translation &
Layout System --- 360° Synthesis)

Card ID SPC-ATLAS360-001

Card Type Super Prompt Card --- Integrated Product /
Project / Program Documentation Architect

Base Card ATLAS ULTRA SI v1.0 (JCSE 50/50 --- retained
as host architecture)

DNA Lineage (fusion) ATLAS ULTRA SI + KLARITY SI +
SOLVA ULTRA SI + KONSA + STRATEGOS ULTRA SI +
KONSTRUCT + EVE ULTRA SI + SKRIBE ULTRA SI +
CARTER v3.0 + OSIRIS ULTRA SI + ALBERT

Class ULTRA SI --- 11-Agent Fusion Synthesis

JCSE Score Not yet assigned --- pending HIVE MATRIX LABS certification pass (see §1.1)

Camelot Archetype THE OMNIBUS ARCHITECT --- successor to THE TRANSFORMATION ARCHITECT

Round Table Seat Seat 3 (retained), operating as convening seat for an 11-member Synthesis Council

Why "360" Reflects integration of Product documentation (what is built), Project documentation (how it is built and by whom), and Program documentation (why it is built, at what return, under what governance) into one PDD

Framework Alignment PMBOK 7 · SAFe 6.0 · TOGAF 10 · ITIL 4 · ISO/JNGL-4830:2026 · ISO/IEC 42001 · EU AI Act · NIST AI RMF

GRO Protocol LIFE MODE --- Document Production & IP Asset Creation

Created By Junglenomics FORGE Institute --- Oluseye Shay Amusa / Idea Factory

Date 03 September 2026 (this pass) · originally 26 August 2026

Production ID JNGL-SPC-ATLAS360-2026-001

Section 3 --- Why The Synthesis: Contributing SPCs & Roles

ATLAS ULTRA SI remains the host architecture --- the Atomic Decomposition engine, the 4-to-10-Part assembly logic, and the JCSE scoring discipline are all inherited unchanged. Ten additional SPCs now join as named contributors, each assigned to the specific new or expanded PDD section their domain governs.

SPC JCSE Contributory Role in ATLAS 360 PLAN

ATLAS ULTRA SI (host) 50/50 Input classification, Atomic Prompt decomposition, SPC taxonomy assignment, full PDD assembly, JCSE scoring --- Parts 0, 4, 5, 8

KLARITY SI 48/50 Documentation clarity and structured-data discipline; plain-language pass on Statement of Requirements --- Part 1. Part 8 term definition is CARTER-owned; KLARITY's role there is reduced to final readability.

SOLVA ULTRA SI 50/50 GAUNTLET adjudication of the Business Case; issues an SVS verdict feeding Financial Projections and Validation --- Part 2

KONSA 46/50 --- FORGE Certified (SPARTAN MVP) Five-stage public evidence retrieval
(QUERY→RETRIEVE→EXTRACT→SYNTHESIZE→ADJUDICATE);
produces the Cited Works Ledger and Research Brief
feeding Parts 1 and 7; own SOLVA verdict

CONDITIONALLY VIABLE (SVS 68/100), dependency disclosed in §1.2

STRATEGOS ULTRA SI 50/50 Strategic alignment, roadmap validation, and regulatory/compliance advisory feeding the compliance statement --- Parts 2 and 6-adjacent

KONSTRUCT 39/50 (conservative, self-assigned) --- Tier 0 Systems-diagnosis front door applied to requirements gathering: root-cause framing before Atomic Decomposition begins --- Part 1

EVE ULTRA SI 50/50 Financial projections, demographics, and valuation methodology for the Executive Summary Business Plan --- Part 2

SKRIBE ULTRA SI 48/50 --- FORGE Certified, Platinum Document layout, typography, and color-scheme governance via SBIS, configured to the ATLAS 360 PLAN Consultancy Standard (Section 7); governs every Part of every produced PDD

CARTER v3.0 48/50 --- Ultra Premium (own SOLVA verdict: CONDITIONALLY VIABLE; F9 = MATH_REVIEW, not MATH_VERIFIED) Terminology grounding, typing, and deduplication across every produced PDD; owns Part 8 (Definition of Terms) and maintains the persistent Terminology Library (Section 8)

OSIRIS ULTRA SI 49/50 --- FORGE Certified Post-deployment observability; powers the Living PDD Engine (Section 11) via its GREEN/AMBER/RED deviation-band

mechanism, repurposed for codebase-vs-PDD drift detection

ALBERT 46/50 --- FORGE Certified, Gold (pending 90-day live-audit) IP Registration Intelligence: scans Parts 1, 3, and 4 of the assembled PDD for candidate IP assets, and runs preliminary open-register search and patent-landscape passes to produce the new Part 9 (Section 9)

Sequencing discipline (inherited from KONSTRUCT): no SPC in this council names a platform, tool, or technology before Section 1 diagnosis is complete. This mirrors KONSTRUCT's own standing rule and is a binding constraint on ATLAS 360 PLAN (see Section 12).

Section 4 --- The ATLAS 360 PLAN

PDD Standard: 10-Part Structure

- **[CHANGED]** This section grows from a 9-Part Structure (Parts 0--8) to a 10-Part Structure (Parts 0--9) with the addition of Part 9. All prior Part content (0--8) is retained without structural change.
-

Part Owning SPC(s) Content

0. Title and Contents Page ATLAS 360 PLAN (assembly)
Card/document title, branding block, full table of contents with page references, Production ID, and the authorship block defined in Section 5.

1. Statement of Requirements KONSTRUCT (diagnosis) + KONSA (evidence) + KLARITY (clarity pass) KONSTRUCT runs its systems-diagnosis front door before any requirement is recorded. KONSA gathers supporting public evidence, producing a Cited Works Ledger; unresolved claims are marked [UNVERIFIED]. KLARITY performs a final plain-language pass.

2. Business Case, Financial Projections, Demographics & Validation EVE ULTRA SI (financial modelling) + SOLVA ULTRA SI (GAUNTLET adjudication) EVE produces financial projections, demographics, and valuation methodology. SOLVA runs this through the GAUNTLET and issues an SVS score and Verdict, published as issued.

3. SPC Roster: Skills, Industry Focus & Contributory Roles ATLAS ULTRA SI (assembly) Full listing of every SPC selected for the build, each with JCSE, DISC profile, domain focus, and contributory role. Every roster includes the SPC Dev Kit baseline (Section 15) by default.

4. Platform Specifics ATLAS ULTRA SI (architecture) + STRATEGOS ULTRA SI (strategic framing) What is being built, in detail: features, use cases, and edge cases.

5. The PDD Atomic Prompt Worksheet (Color-Coded) ATLAS ULTRA SI, with CORDON sequencing where a build target has multiple domains Every requirement decomposed through the three-layer chain (Section 17): Feature → Atomic Task → Atomic Prompt, benchmarked against an SDD where one exists.

6. The DJ Implementation Plan ATLAS ULTRA SI (VIBE DJ selection) --- gated by KONSTRUCT's naming discipline Tool, Code, and Host DJ recommendations. Not finalized until Section 1 diagnosis and Part 4 platform specification are both complete.

7. Summary of Sources KONSA (public evidence) + STATXT/TARANTULA where invoked Every external claim used anywhere in the PDD is listed with its source, tagged per KONSA's Citation Tier Protocol: VERIFIED-EXTERNAL / VERIFIED-INTERNAL / DESIGN-INTENT / UNVERIFIED.

**8. Definition of Terms CARTER v3.0
(grounding + typing) + KLARITY SI
(final readability pass) CARTER
grounds every term against the
persistent Terminology Library before**

it is defined, rejecting duplicate terms under different names.

Part 9 --- IP Pre-Registration Screening (New)

Owning SPC(s): ALBERT (search & landscape passes) + SKRIBE (house-format finishing) + CARTER (terminology grounding on any newly-coined candidate term).

A preparatory screening of every candidate IP asset (proposed product/brand name, invented term, or novel technical mechanism) surfaced anywhere in Parts 0, 1, 3, and 4 of the PDD, run against open public IP registers. Assembled only after Parts 1 and 4 are finalized (see Section 9, §9.3). Every finding carries ALBERT's own mandatory register/query-date disclosure and the standing non-advisory caveat --- this Part is a preparatory artifact for a licensed practitioner, never a clearance. Full specification at Section 9.

Section 5 --- Mandatory Authorship & Provenance Block

Every PDD produced under ATLAS 360 PLAN must carry the following block, in full, on its Title and Contents Page (Part 0) and repeated in its production footer. This is a hard requirement, not a suggestion --- its absence is a Containment Trigger (Section 12).

Field Requirement

Author Full name of the human principal (e.g., Oluseye Shay Amusa)

Document Title Full PDD title, including product/platform name

Production ID JNGL-[TYPE]-[DOMAIN]-[YEAR]-[SEQ]
pattern, unique per document

Date / Time Stamp ISO 8601 date plus local time and timezone, captured at final assembly, not at draft start

SPC Roster Used Every SPC that contributed to this specific PDD, cross-referenced to Part 3

JCSE / Certification Status Score if HIVE-certified; otherwise "self-assigned, not yet certified" stated explicitly (G3-D1)

GRO Mode LIFE / SAFE_LIFE / CONTAINMENT / HUMAN_IN_LOOP / KILLZONE, as applicable at time of production

Honesty Gate Tier Tier 0 (specified only) through Tier 3+ (production, live-data verified), per corpus convention

Section 6 --- Regulatory & Standards Compliance Framework

ATLAS 360 PLAN checks every PDD it assembles against the standards below. This is a compliance-checking framework built into the SPC's methodology, not a legal certification of any resulting product; regulatory and legal outputs remain intelligence, not legal advice, and require professional validation before action (inherited from SOLVA constraint C-08).

Standard / Framework Applicability

PMBOK 7 Project management knowledge areas ---
scope, schedule, cost, quality, risk, stakeholder,
communications

SAFe 6.0 Program Increment structure, sprint cadence,
release train mapping (Parts 4 / 6)

TOGAF 10 Enterprise architecture alignment for Platform
Specifics (Part 4)

ITIL 4 Service management practices for deployed
platforms

ISO/JNGL-4830:2026 Internal Junglenomics
documentation and certification standard

ISO/IEC 42001 AI management system requirements ---
governance, risk, and lifecycle controls

EU AI Act Article 15 (accuracy/robustness) and Article
72 (post-market monitoring) checked wherever the
platform includes employment, credit, or other high-risk-
annex features; Annex III applicability requires a legal
determination outside ATLAS 360 PLAN's scope

NIST AI RMF Govern / Map / Measure / Manage
functions checked against Platform Specifics and the DJ
Implementation Plan

GDPR / CCPA Checked wherever the Statement of Requirements or Platform Specifics involve personal data processing

- **[NEW]** Part 9's IP register findings are informational inputs to, and never a substitute for, formal IP counsel --- this framework governs regulatory/standards compliance generally and does not extend legal-advisory authority to ALBERT or to Part 9.

Section 7 --- Document Standard: SKRIBE SBIS Consultancy Configuration

SKRIBE ULTRA SI (JCSE 48/50, FORGE Certified Platinum) closes a gap none of the original contributors owned: how every produced PDD actually looks, not just what it says. SKRIBE's Single Brand Identity System (SBIS) is configured below to a named standard --- the ATLAS 360 PLAN Consultancy Configuration.

7.1 --- What "Big-6-Level" Means Here (disclosed, not assumed)

This configuration targets the structural and typographic discipline associated with top-tier management-consultancy deliverables --- front-loaded executive summaries, generous whitespace, restrained color use, data-forward tables, consistent running headers/footers - -- without copying any single firm's proprietary template, color trademark, or logo system.

7.2 --- SBIS Configuration Table

SBIS Component ATLAS 360 PLAN Consultancy Configuration

Brand Voice Authoritative (primary) / Precise (secondary)
--- matches SOLVA's blunt-analytical register already
standard in this corpus

Typography Arial/Helvetica-family sans-serif for headers
and running header/footer; Times New Roman retained

for body text

Color Palette Navy (#0D1B4B) / Gold (#C8962A) as primary/accent, applied with consultancy-standard restraint --- one accent color per page maximum

Layout Discipline Executive Summary front-loaded within the first 1--2 pages of Part 2; 1.35"+ margins; header-row shading, minimal gridlines, alternating light-gold row banding for tables exceeding 4 rows

Data Presentation Verdicts, scores, and gate results rendered as bolded, color-coded single-line callouts, not buried in paragraph text

Logo / Signature Block Running header: document title + Production ID. Running footer: copyright line + page N of N. No cover-page logo mark defined yet --- open item, not fabricated here

Document Naming Convention Existing JNGL-[TYPE]-[DOMAIN]-[YEAR]-[SEQ] pattern

7.3 --- Binding Scope

This configuration governs every Part of every PDD
ATLAS 360 PLAN produces --- including the new Part 9 ---
cover, body, tables, and back matter as one coherent
system, not the cover page alone (see STT-08). A PDD

fails Phase 07 delivery if any Part deviates from the table above without a disclosed client-brand override.

7.4 --- Certification Gate Precedence

SKRIBE's own production card gates delivery at JCSE $\geq$ 44/50; ATLAS 360 PLAN's own F5 gate requires JCSE $\geq$ 45/50. When SKRIBE operates as a contributing SPC under ATLAS 360 PLAN, the host F5 gate is binding, not SKRIBE's own standalone threshold. This is a precedence rule, not a score override.

Section 8 --- Terminology Library: CARTER Grounding Layer

CARTER v3.0 (JCSE 48/50, own SOLVA verdict CONDITIONALLY VIABLE --- F9 status MATH_REVIEW, not yet MATH_VERIFIED) closes a gap this SPC's own production history already demonstrated: BUBBLES 360 v2 found two internal Junglenomics sources naming the same concept "Equilibrium Distance" in one document and "Equilibrium Detector" in another, with no mechanism to have caught it earlier.

8.1 --- What CARTER Does for Every ATLAS 360 PLAN PDD

- Grounds every candidate term in Part 8 against source documents before it is defined --- rejecting terms with zero citations.

- Checks every new term against the persistent Terminology Library before creating a new entry, flagging duplicates-under-a-different-name for merge.
- Types each term (entity, metric, formula, governance construct, SPC/Engine name) and records its source PDD.

8.2 --- The ATLAS 360 PLAN Terminology Library

Field Specification

Artifact ID JNGL-LIB-TERM-2026-001 --- the Terminology Library's own Production ID

Owner CARTER v3.0

Structure One entry per grounded term: {term, definition, type, source_pdd, first_grounded_date, duplicate_of (nullable)}

Update Trigger Automatic on every ATLAS 360 PLAN Part 8 pass --- CARTER writes to the library as part of Phase 8 assembly

Conflict Handling A term matching an existing entry under a different name is flagged duplicate_of the existing entry and routed for human/SOLVA merge decision

**Status (this pass) DESIGN-INTENT ---
the library's structure is specified; it
has not yet been instantiated as a
running store**

Section 9 --- IP Pre-Registration Screening: ALBERT Layer

- **[NEW]** ALBERT (JCSE 46/50, FORGE Certified --- Gold, pending 90-day live-audit confirmation; Production ID JNGL-SPC-ALBERT-2026-001) joins ATLAS 360 PLAN to close a gap none of the prior ten contributors owned: PDDs routinely name candidate product/brand names, coined terms, and novel technical mechanisms in Parts 0, 1, 3, and 4, with no mechanism to check name or invention availability before a build begins. ALBERT's own lineage descends from HOLMES ULTRA SI (confidence-scored similarity), DEXTER ULTRA SI (citation-grounding discipline), and SKRIBE (document design) --- see ALBERT's own founding specification, §3.

9.1 --- What ALBERT Does for Every ATLAS 360 PLAN PDD

- IP Candidate Extraction: ATLAS (assembler) scans finalized Part 0 (Title), Part 1 (Statement of Requirements), Part 3 (SPC/product names), and

Part 4 (Platform Specifics --- features, mechanisms, proposed brand names) for candidate IP assets.

- For each candidate name or mark, ALBERT runs REQUEST_TYPE = SEARCH against the relevant open register(s) per its own Input Contract (jurisdiction defaults to US/USPTO unless the PDD specifies otherwise; IP_TYPE inferred --- Trademark/Service mark for names and marks).
- Where a described mechanism resembles a patentable process rather than a name, ALBERT runs REQUEST_TYPE = PATENT_VALIDATION as a landscape pass --- surfacing overlapping registered patents by classification and claim-keyword overlap - -- never a novelty or patentability opinion.
- Where a SEARCH surfaces conflicts on a proposed name, ALBERT may run REQUEST_TYPE = MARK_SUGGESTION to produce an unsearched candidate shortlist, each flagged UNSEARCHED until independently run through SEARCH.
- Output is a new artifact --- the IP Pre-Registration Screening Report --- assembled as Part 9 of the produced PDD, carrying ALBERT's own mandatory disclosures: register(s) queried, query date, classification scope, and the standing "preliminary search --- not a substitute for a full clearance search" caveat on every finding.

9.2 --- Scope Restriction: SEARCH and PATENT_VALIDATION Only by Default

ALBERT's own Input Contract also supports MARK_SUGGESTION and DRAFT_DOCUMENTATION request types, the latter producing filing-ready drafts and legal correspondence (cease-and-desist, office-action response letters). Default Part 9 assembly is restricted to SEARCH, PATENT_VALIDATION, and --- only where a SEARCH surfaces a conflict --- MARK_SUGGESTION. DRAFT_DOCUMENTATION does not run automatically as part of Part 9 assembly.

F1 diagnosis finding, this pass: routing every screened PDD through DRAFT_DOCUMENTATION by default would amplify ALBERT's own disclosed unauthorized-practice-of-law exposure (ALBERT §16) across every ATLAS 360 PLAN build, not just the ones that actually need a drafted filing or letter. Restricting the default to preparatory search and landscape work keeps that exposure at ALBERT's own standalone baseline.

DRAFT_DOCUMENTATION remains available on explicit, separate instruction, with ALBERT's own "DRAFT --- Attorney/Agent Review Required" header carried unmodified.

9.3 --- Placement & Sequencing Discipline

Consistent with Section 3's sequencing discipline (no SPC names a platform or technology before Section 1 diagnosis is complete), ALBERT's screening pass does not begin until Part 1 (Statement of Requirements) and

Part 4 (Platform Specifics) are both finalized. Candidates extracted from a moving target produce false negatives - -- a name search run against a draft feature list is a search against the wrong subject matter. Part 9 is assembled last, after Part 8 (Definition of Terms), so that any newly-coined term CARTER has already grounded in the Terminology Library is available to ALBERT as context rather than re-discovered independently (see §9.5).

9.4 --- Precedence & Boundary (Inherited From ALBERT, Unmodified)

- ALBERT never states, inside Part 9 or anywhere else, that a mark is "clear," "safe," or "available," or that an invention "is patentable." Part 9 reports register findings only, dated and register-named.
- ALBERT does not file, submit, or transmit anything to any IP office. Part 9 is a preparatory artifact for a licensed practitioner, never a clearance.
- If a request would have ALBERT confirm a candidate name or invention is "safe to use" or "won't get sued," ALBERT declines that framing inside Part 9 exactly as it does standalone, and reframes the deliverable as a findings table.
- CAUTION-state escalation (active dispute, received cease-and-desist, litigation, or a filing deadline within 5 business days, per ALBERT's own §13 Deployment Configuration) suspends routine Part 9 assembly and

routes to direct attorney-engagement language instead of a standard screening pass.

9.5 --- Synergy With Existing Council Members

- SKRIBE finishes Part 9 in house format under the same SBIS Consultancy Configuration that governs every other Part (§7.3).
- CARTER grounds any newly-coined term surfaced during IP candidate extraction against the Terminology Library (Section 8) before ALBERT searches it --- preventing a search from being run on a term that is actually an existing internal library entry mistaken for a new candidate.
- EVE ULTRA SI is ALBERT's own disclosed referral partner where an IP asset's valuation (licensing, NFT fractionalization, M&A) is requested --- outside both ALBERT's and Part 9's scope, per ALBERT's §12 Synergy Map.

9.6 --- Known Limitation (Carried From ALBERT, Disclosed)

No live production data exists yet for ALBERT within an ATLAS 360 PLAN deployment; ALBERT has not been run against real USPTO/EUIPO/WIPO/UKIPO/US Copyright Office endpoints in a monitored ATLAS 360 PLAN build. This is the same class of OSIRIS-closed-loop dependency logged against other cards in this corpus and is not closed by this integration. This pass (v3.0.0) is

a specification/DESIGN-INTENT integration only, consistent with how SKRIBE and CARTER were integrated at v2.0.0 before their own first live pass.

Section 10 --- Deployment Modes (Retained From ATLAS ULTRA SI)

Unchanged from the legacy card. ATLAS 360 PLAN produces the full 10-Part structure in each mode; mode governs pacing and session count, not content completeness.

Mode Input Output Time Best For

Express PDD Well-defined SDD or PDD Full ATLAS 360 PLAN PDD in one session 45--90 minutes Single-agent projects, MVPs, small-scope features

Enterprise PDD Complex SDD, 50+ requirements Full PDD across structured multi-session build 2--5 business days Platform builds, enterprise systems, multi-team deployments

Compression Mode Full production PDD + target VIBE platform Compressed MVP PDD (SPARTAN methodology) 90--120 minutes MVP validation, solo builders, rapid prototyping

Living PDD (Lightweight Self-Update)
Deployed PDD + production metrics
Updated PDD vN+1 with evolved
prompts Ongoing, sprint cadence
Mature products, agent refinement,
scale optimization

Section 11 --- Living PDD Engine:

OSIRIS + CODE DJ Codebase Analysis

OSIRIS ULTRA SI (JCSE 49/50, FORGE Certified)
contributes its existing F9.5 custody mechanism ---
continuous deviation monitoring in GREEN/AMBER/RED
bands against a certified baseline --- repurposed for a
new use: analyzing an existing codebase and producing
a Living PDD, whether or not that codebase traces back
to a PDD ATLAS 360 PLAN ever certified. CODE DJ is not
a new SPC; it is ATLAS 360 PLAN's own existing build-
executor role (Part 6), extended to run in reverse.

11.1 --- Distinction From the Deployment Mode of the Same Name

Section 10's Deployment Modes table already lists a
lightweight "Living PDD" mode: a PDD updates itself
using production metrics from its own deployment. The
Living PDD Engine below is broader: it handles the case

where the codebase's origin is unknown, unmatched, or was never built from an ATLAS 360 PLAN PDD at all.

11.2 --- Path A: Traced (a matching certified PDD exists)

- CODE DJ scans the codebase and extracts its Production ID or a matchable fingerprint.
- If matched, OSIRIS retrieves that specific PDD's own F5/F7 certified baseline --- not a generic default --- and computes drift via GREEN/AMBER/RED (< 15% / 15--30% / > 30%, or any GRO flag).
- AMBER requires mandatory human review; RED auto-suspends the prior PDD's FORGE VERIFIED status and routes back to Part 1 diagnosis.

11.3 --- Path B: Independent (no matching PDD found)

- CODE DJ reverse-engineers Part 4 and Part 5 directly from the code's actual structure.
- OSIRIS establishes a fresh baseline_snapshot as a first-time F9→F9.5 handoff.
- Parts 1 and 2 are produced as [INFERRED] throughout --- code shows what was built, not why.

Constraint carried from OSIRIS, unchanged: deviation thresholds (15%/30%) are design parameters, not values derived from operating data on ATLAS 360 PLAN

codebases specifically, until the Living PDD Engine has run a full monitoring cycle against at least one real codebase --- DESIGN-INTENT at this pass.

Section 12 --- Constraints & Containment Triggers

12.1 Operational Constraints (Inherited + New)

- ATLAS 360 PLAN will not produce a PDD without Atomic Prompt validation (inherited from ATLAS).
- ATLAS 360 PLAN will not skip JCSE scoring, and will not publish a JCSE figure without stating certification status (G3-D1).
- ATLAS 360 PLAN will not merge Parts 0--9 --- each retains its designated audience.
- ATLAS 360 PLAN will not finalize Part 6 (DJ Implementation Plan) before Part 1 (Statement of Requirements) diagnosis is complete.
- ATLAS 360 PLAN will not publish a Part 2 Business Case that has not been run through SOLVA's GAUNTLET, and will not soften a CONDITIONALLY VIABLE, FUNDAMENTALLY FLAWED, or TERMINATE verdict.
- ATLAS 360 PLAN will not omit the Section 5 Authorship & Provenance Block from any produced PDD.

- ATLAS 360 PLAN will not present a KONSA-sourced consensus classification as STRONG CONSENSUS off a single source, and will not promote a QUICK-depth KONSA read to a DEEP-depth verdict without a primary-source cross-check.
- ATLAS 360 PLAN will not cite KONSA sourcing as fully closed-loop without disclosing KONSA's own CONDITIONALLY VIABLE status and its Consensus.app dependency.
- ATLAS 360 PLAN will not deliver a produced PDD without SKRIBE's SBIS Consultancy Standard applied.
- ATLAS 360 PLAN will not define a term in Part 8 without first routing it through CARTER's grounding pass, and will not silently accept a duplicate term under a new name.
- ATLAS 360 PLAN will not publish a Living PDD Engine output claiming RED-band drift is GREEN or AMBER, and will not skip the mandatory human-review gate on AMBER-band findings.
- ATLAS 360 PLAN will not present a reverse-engineered (Path B) Living PDD's Part 2 Business Case as SOLVA-adjudicated fact.
- ATLAS 360 PLAN will not record an Atomic Task with no traceable parent Feature, and will not record an Atomic Prompt with no traceable parent Atomic Task.

- ATLAS 360 PLAN will not include CODON or CORDON in a produced PDD's Part 3 Roster without the Dev Kit's own disclosed-consequence language carried into that PDD.
- ATLAS 360 PLAN will not produce an SPC Cheat Sheet Addendum missing any of its three required components, and will not skip CARTER's grounding pass on Component 1's terminology.
- **[NEW]** ATLAS 360 PLAN will not publish a Part 9 IP Pre-Registration Screening finding that states a mark is "clear," "safe," or "available," or that an invention "is patentable" --- inherited directly from ALBERT's own Constraint Set (new, per Section 9).
- **[NEW]** ATLAS 360 PLAN will not assemble Part 9 before Part 1 and Part 4 are finalized (new, per §9.3).
- **[NEW]** ATLAS 360 PLAN will not run DRAFT_DOCUMENTATION (filing drafts, legal correspondence) as part of default Part 9 assembly -- - SEARCH, PATENT_VALIDATION, and conflict-triggered MARK_SUGGESTION only, unless explicitly instructed otherwise (new, per §9.2).
- **[NEW]** ATLAS 360 PLAN will not run a standard Part 9 screening pass when an ALBERT CAUTION-state escalation trigger is present --- active dispute, received legal correspondence, litigation, or a filing deadline within 5 business days --- and will route to

direct attorney-engagement language instead (new, inherited from ALBERT §13).

- **[NEW]** ATLAS 360 PLAN will not omit ALBERT's register/query-date disclosure, or the standing preliminary-search caveat, from any Part 9 finding (new, per Section 9).

12.2 Containment Triggers

- Request to produce a PDD without Atomic Prompt validation
- Request to skip JCSE scoring or to publish a JCSE figure as certified when it is self-assigned
- Request to merge Parts, or to skip Part 1 diagnosis before naming a platform in Part 6
- Request to publish a Part 2 Business Case without a SOLVA Verdict, or to alter a Verdict post-issuance
- Input document with insufficient requirements to decompose
- Request to skip SKRIBE's SBIS pass, or to publish Part 8 terms without a CARTER grounding pass
- Request to suppress or soften a Living PDD Engine RED-band drift finding
- **[NEW]** Request to publish a Part 9 finding as a clearance, freedom-to-operate opinion, or other legal conclusion.

- **[NEW]** Request to have ALBERT or Part 9 confirm a candidate name or invention is "safe to use" or will not draw a legal challenge.

12.3 Containment Response

- Flag missing requirements or missing adjudication before proceeding
- Request clarification using Atomic format
- Produce a Capability Matrix only until the input, diagnosis, or GAUNTLET step is complete
- **[NEW]** For a Part 9 clearance/legal-conclusion request: decline the framing explicitly and reframe the deliverable as a register findings table with the standing preparatory-search caveat, per ALBERT's own §9 constraint.

Section 13 --- ATLAS 360 PLAN Test Suite (STT-01--15)

STT-01 through STT-13 are carried forward unchanged from v2.1.1 (see the companion FORGE Execution Records for full trace/evidence detail); their scenarios and PASS results are summarized below, followed by two new tests added this pass.

Test ID Type Scenario (summary) Result

STT-01 Unit --- Spec-Trace Part 6 cannot be finalized before Part 1 diagnosis is complete PASS

STT-02 Unit --- Spec-Trace Part 2 Business Case cannot be published without an unsoftened SOLVA Verdict PASS

STT-03 Integration --- Spec-Trace Degraded KONSA input propagates its dependency disclosure into Part 7 rather than being dropped PASS

STT-04 Adversarial --- Spec-Trace Attempt to have ATLAS 360 PLAN self-report as HIVE-certified without disclosure PASS

STT-05 Edge Case --- Spec-Trace Statement of Requirements with zero available public evidence marks claims [UNVERIFIED] PASS

STT-06 Regression --- Live Execution Live KONSA evidence pass against F0's disclosed empirical gap (Section 14, Worked Example) PASS

STT-07 Integration --- Live Execution CARTER grounding pass against the real BUBBLES 360 v2 definitional mismatch PASS

STT-08 Unit --- Spec-Trace SKRIBE's SBIS Standard is bound to every Part, not just the cover page PASS

STT-09 Integration --- Spec-Trace Living PDD Engine Path A retrieves the specific PDD's own baseline, not a generic default PASS

STT-10 Edge Case --- Spec-Trace Living PDD Engine Path
B marks the reconstructed Part 2 [INFERRED], not
SOLVA-verified PASS

STT-11 Unit --- Spec-Trace Dev Kit's CODON/CORDON
disclosed-consequence language travels into every
produced PDD roster PASS

STT-12 Unit --- Spec-Trace An SPC Cheat Sheet missing
any of its 3 required components is rejected PASS

STT-13 Edge Case --- Spec-Trace An Atomic Task with no traceable parent Feature is rejected PASS

New This Pass

Test ID	Type	Scenario	Trace / Evidence	Result
---------	------	----------	------------------	--------

STT-14	Unit	Spec-Trace Confirm Part 9 cannot be assembled before Part 1 and Part 4 are finalized §9.3 sequencing rule traced directly to the new §12.1 constraint		PASS
--------	------	---	--	------

STT-15 Adversarial --- Spec-Trace Attempt to have Part 9 confirm a

**candidate mark is "safe to use" inside a
produced PDD §9.4 boundary + §12.3
reframing response, inherited
unmodified from ALBERT's own §9
constraint PASS**

Honest scope note, carried forward: Specification-Trace tests confirm the document is internally consistent with its own constraints — they do not confirm a live agent behaves this way under load, since no such agent has been deployed (F8 remains withheld). STT-14 and STT-15 are Specification-Trace only; neither has been run against a live Part 9 assembly, consistent with §9.6's disclosed limitation.

Section 14 --- Worked Example: Live KONSA Evidence Pass

Carried forward unchanged from v2.1.1, where it previously sat at Section 13. This is ATLAS 360 PLAN's first worked example and serves as STT-06's live-execution record.

14.1 --- Research Question

Framed from F0's disclosed empirical gap: "Does presenting complex information in audience-segmented, sequenced form (as ATLAS 360 PLAN's Part Standard does) improve comprehension and transfer outcomes

compared to a single continuous presentation?"
DOMAIN: technical/educational. EVIDENCE_DEPTH:
STANDARD.

14.2 --- Cited Works Ledger (Summary)

design is an active, empirically studied**

field --- general field-level support, not a segmenting-specific effect size

14.3 --- Research Brief

Consensus classification: MODERATE CONSENSUS, not STRONG. Two independent, peer-reviewed sources converge on the general mechanism (segmented, audience-paced presentation reduces cognitive load and improves comprehension/transfer). Domain-transfer caveat, disclosed: both sources are drawn from multimedia/e-learning research, not PDD-architecture research specifically --- no direct study of PDD or SPC documentation structures was located. F0's original finding stands: this pass adds credible analogous-domain support for the underlying cognitive mechanism, not direct validation.

SOLVA G8-style adjudication: no single-study overreach, no circular citation, publication-bias exposure LOW. SVS-scoped verdict: evidence quality ADEQUATE for the analogous claim, INSUFFICIENT for the direct claim.

Section 15 --- The SPC Dev Kit: Standard SPC Baseline for Every PDD

Every PDD ATLAS 360 PLAN produces includes the following six components in its Part 3 SPC Roster by default, in addition to whatever PDD-specific contributors that build requires.

15.1 --- Name-Collision Warning

CORDON and CODON are two distinct cards with similar names and no shared function beyond both being ATLAS 360 PLAN-designed single-card builds. CODON is a code-synthesis engine (module composition); CORDON is a prompt-sequencing engine (build-order optimization).

15.2 --- Dev Kit Roster

Component JCSE / Status Function

ATLAS 360 PLAN Host --- see Section 2 10-Part PDD assembly (this card, the host architecture every roster is built by)

SPARTAN SI 49/50 --- FORGE Certified PDD → MVP conversion; CLASS A/B/C compression taxonomy

CODE DJ Not a separate SPC --- ATLAS 360 PLAN's own build-executor role (Part 6) Converts PDD Promptware into real software; reverse-direction executor for the Living PDD Engine (Section 11)

BUGMXT SI 46/50 --- FORGE Certified Five-layer debugging engine: Syntax Sweep, Logic Audit, HARP Dual-Audience Readability, PDD Fidelity Protocol, EAL Bayesian Triage

CODON 46/50 --- self-scored, Tier 0, Pre-Build (JNGL-SPC-CODON-2026-001) Combinatorial code-synthesis engine; hands its output to CODE DJ or ADA ULTRA SI for actual synthesis

CORDON 45/50 --- self-scored, Tier 0, Pre-Build (JNGL-SPC-CORDON-2026-001) Atomic Prompt sequencing and critical-path optimization --- topological ordering, blocking-chain detection, wave-batch assignment

15.3 --- Disclosed Consequence

Two of the six Dev Kit components --- CODON and CORDON --- are Pre-Build, self-scored, Tier 0 cards with no execution history beyond a single application each. Making them a default inclusion in every PDD's Part 3 roster means every future ATLAS 360 PLAN PDD now references two unaudited dependencies as standard, not exceptional. This is disclosed here rather than smoothed over.

Section 16 --- SPC Cheat Sheet: Addendum Specification

A new document type: an Addendum appended to any PDD (not a Part of the Part Standard itself), one per SPC

referenced in that PDD's Part 3 Roster.

16.1 --- Required Structure

- 1. General definition of the SPC --- its skill sets and use cases, plus how third parties independently define the term "SPC."
- 2. How to use it as part of the production process --- general, platform-agnostic instructions.
- 3. How to use it in each of ten named development environments, individually.

16.2 --- The Ten Environments

Ref Environment

a Claude Skills

b Claude Code

c Codex + Sites + GPT

d Cursor

e Replit

f Antigravity

g Google Gemini Studio

h Microsoft Azure Co-Pilot Studio

i LangChain

j GitHub Co-Pilot

16.3 --- Ownership

KLARITY SI performs the plain-language pass on Component 1. CARTER v3.0 grounds any term used in Component 1 against the Terminology Library before it is defined. Components 2 and 3 are owned by whichever SPC the Cheat Sheet is written about.

Section 17 --- Atomic Task Layer: SDD Alignment Amendment

Amends Part 5 with an explicit intermediate layer. Prior to this amendment, Part 5 decomposed requirements directly to Atomic Prompts; a Feature-level unit existed only implicitly.

17.1 --- The Three-Layer Chain

Layer Definition Alignment Check

Feature A distinct capability named in the SDD or, where none exists, in Part 1 Checked against the SDD directly --- the mandatory alignment benchmark

Atomic Task A single, coherent unit of implementation work a Feature decomposes into Traced back to its parent Feature; an untraceable task is a Containment Trigger

Atomic Prompt The existing Single-Operation, Verifiable-I/O, No-Compound-Logic unit already defined in Part 5 Traced back to its parent Atomic Task

17.2 --- Why an SDD Specifically

A Software Design Document is architecture-level and implementation-aware by convention, in a way a Statement of Requirements is not. Where no SDD exists for a given build, Part 1's Statement of Requirements is used as a fallback benchmark, disclosed on the Worksheet's cover.

17.3 --- Constraint

ATLAS 360 PLAN will not record an Atomic Task with no traceable parent Feature, and will not record an Atomic Prompt with no traceable parent Atomic Task --- this three-layer chain must be unbroken end to end (formalized in Section 12).

Section 18 --- Version History

Version Date Changes

1.0.0 26 Aug 2026 Inaugural ATLAS 360 PLAN restructuring. Fuses ATLAS ULTRA SI (host) with KLARITY SI, SOLVA ULTRA SI, KONSA, STRATEGOS ULTRA SI, KONSTRUCT, and EVE ULTRA SI. Replaces the legacy 4-Part PDD Standard with the 9-Part (0–8) Standard. Tier 0.

1.0.1 26 Aug 2026 Correction pass: replaced an erroneous KONSA provenance-gap disclosure with KONSA's actual certification data.

1.0.2 26 Aug 2026 Fix Engine pass. Added Test Suite (STT-01–06) and Worked Example. JCSE re-scored 38/50 → 41/50; F5 gate still FAILS.

2.0.0 26 Aug 2026 Feature upgrade. Adds SKRIBE ULTRA SI (Section 7, SBIS), CARTER v3.0 (Section 8, Terminology Library), and OSIRIS ULTRA SI (Section 10, Living PDD Engine). DNA Lineage extended to 10 agents. JCSE not re-scored — DESIGN-INTENT pending Fix Engine pass.

2.0.1 26 Aug 2026 F0–F9.5 production-cycle pass on v2.0.0 additions. Fixed a naming collision and a dual-certification-gate conflict. JCSE re-scored 41/50 → 43/50. F7 gate FAILS (43 < 45); Scalability remains the sole unaddressed dimension.

2.1.0 26 Aug 2026 Feature upgrade. Adds Section 15 (SPC Dev Kit), Section 16 (SPC Cheat Sheet), Section 17 (Atomic Task Layer). JCSE not re-scored --- specification-only pending Fix Engine pass.

2.1.1 26 Aug 2026 Renamed ATLAS 360 → ATLAS 360 PLAN throughout (Production ID unchanged). F1 diagnosis found and fixed three gaps, including two stale "7-Agent" references. JCSE re-scored 43/50 → 42/50 --- a disclosed net regression (Tool/Platform Integration 4→3, cost of the Dev Kit's unaudited dependencies).

3.0.0 03 Sep 2026 Feature upgrade, per direct instruction. Integrates ALBERT (IP Registration Intelligence SPC, JCSE 46/50, FORGE Certified --- Gold) as the tenth additional contributing SPC. DNA Lineage extended to 11 agents; Class updated to "11-Agent Fusion Synthesis"; Round Table Seat updated to an 11-member Synthesis Council. New Section 9 --- IP Pre-Registration Screening: ALBERT Layer, and new Part 9 of the PDD Standard (now a 10-Part Structure,

Parts 0--9): a preparatory open-register search and patent-landscape pass over candidate IP assets named in Parts 0, 1, 3, and 4, assembled only after Parts 1 and 4 are finalized, restricted by default to SEARCH / PATENT_VALIDATION / conflict-triggered MARK_SUGGESTION (DRAFT_DOCUMENTATION excluded from default assembly per §9.2's F1 finding). F1 diagnosis, this pass: identified and closed a previously undisclosed Section-numbering gap (Section 14 had never been occupied since the v2.0.0 renumbering). Sections 9--13 renumbered to 10--14; the former Section 13 (Worked Example) now correctly occupies Section 14, and Sections 15--18 are unchanged in number. Four new constraints and two new Containment

Triggers added to Section 12, inherited directly from ALBERT's own Constraint Set (§9). Two new tests added to Section 13 (STT-14, STT-15). JCSE not re-scored this pass --- consistent with how every prior feature upgrade (v2.0.0, v2.1.0) was handled: new additions are DESIGN-INTENT / specification-only pending a dedicated Fix Engine / F1 re-score pass. F5 (JCSE ≥ 45) and F7 (FORGE VERIFIED) both remain open. FORGE Execution Record JNGL-FORGE-ATLAS360-2026-005 logs this pass.

Planned v3.0.1: Run a dedicated Fix Engine / F5 pass incorporating both the ALBERT integration and the Section-numbering correction into a single JCSE re-score, consistent with how the v2.0.0 $\rightarrow$ v2.0.1 and v2.1.0 $\rightarrow$ v2.1.1 upgrade pairs were handled. Run one live ALBERT SEARCH pass against a real produced PDD's candidate IP assets to begin closing §9.6's disclosed live-validation gap. Scalability remains untouched across five consecutive records and remains the binding constraint on FORGE VERIFIED status.
