

ATANDA Command Centre — Tiers, Ingestion & Cartridge for Dummies

A plain-English, scenario-first guide to what you get, what it costs, and which lane is right for you.

Before we start: what is the Command Centre, really?

Think of the Command Centre as a **prompt-engineering studio with a built-in inspector**. You bring a rough idea. The HARNESS — a pipeline of seven engines called **F1 !' F7**— interrogates it, sharpens it, and produces a certified design document at the end. A bonus engine, **F8 Code DJ**, can take that document and scaffold a starter codebase for you.

There are two ways to pay:

- 1. **A monthly or yearly subscription** — best if you'll run more than a couple of projects.
- 2. **Per-project credits** (Ingestion or Cartridge) — best if you only need to ship *one* thing and want a one-time fee.

You can mix and match. A free Explorer account can still buy a single Ingestion or Cartridge credit and use it.

Part 1 — The Subscription Tiers

There are **four** tiers. From smallest to largest:

	Explorer	**Practitioner**	**Architect**	**Institution**
Monthly	\$0	\$49	\$199	Talk to us
Yearly	\$0	\$470 (save ~20%)	\$1,910 (save ~20%)	Talk to us
Free trial	—	30 days	30 days	—
F1 (Prompt Diagnostic) per day	5	50	unlimited	unlimited
F2 (Atomic Prompt) per day	3	25	unlimited	unlimited
F3 (Micro-Agent Birth) per day	1	10	unlimited	unlimited
F4 (Micro PDD) per day	1	10	unlimited	unlimited
F5 (Full SPC) per day	**locked**	5	unlimited	unlimited

F6 (ATLAS PDD) per day	**locked**	5	unlimited	unlimited
F7 (MVP PDD, certified)	**locked**	3	unlimited	unlimited
F8 (Code DJ — scaffolds code)	**locked**	**locked**	2	unlimited

A few rules in plain English:

- **"Locked" means the button is greyed out.** The system won't even try. You'll see a "Upgrade to use this engine" prompt.
- **Daily limits reset at midnight UTC.** If you hit your F1 cap at 11pm, you only wait an hour.
- **Cancelling at any time is fine.** You keep access until the end of the period you've paid for.

Scenario 1 — "I just want to see what this thing is"

***Meet Amara.** She heard about ATANDA on a podcast and wants to kick the tyres before deciding anything.*

Pick: Explorer (free).

What Amara can do today:

- Run **F1** five times to score her raw idea against the 7-pillar JCSE rubric.
- Push her best idea through **F2** to turn it into a clean Atomic Prompt.
- Run **F3** once to grow her first Micro-Agent.
- Run **F4** once to turn that into a Micro PDD.

What she can't do yet: F5 (Full SPC), F6 (ATLAS PDD), F7 (the certified MVP PDD), and F8 (Code DJ) are all locked. That's fine — she'll have a clear picture of how the engines feel before paying a cent.

When to upgrade: the moment she wants the certified final document at the end of the pipeline, or hits the daily cap.

Scenario 2 — "I'm a solo founder building one product seriously"

***Meet Ben.** He's a one-person startup, building a real product. He runs maybe two or three sessions a day, refines them, and wants a proper certified MVP PDD he can put in front of an investor or a developer.*

Pick: Practitioner — \$49/month (or \$470/year and save two months).

What Ben gets:

- All of F1 !' F7 unlocked. He can take any idea from raw thought to **SPARTAN-certified MVP PDD** with a public verification URL.
- A 30-day free trial — he can build his first full PDD before his card is charged.
- Generous daily limits: 50 prompt diagnostics, 25 atomic-prompt builds, plenty of headroom for serious work.
- 3 certified MVP PDDs per day — more than enough for an individual.

What Ben does NOT get: F8 Code DJ. If he wants a code scaffold at the end, he either upgrades to Architect for a month, or he hands the MVP PDD to a developer (which is what the document is

designed for).

When to upgrade to Architect: when Ben starts wanting working code at the end of every session, or when he hits the F7 cap of 3/day regularly.

Scenario 3 — "I'm a technical lead, and I want code at the end"

Meet Chen.** She's a CTO at a small agency. She runs a session for every client brief, and she wants the final artefact to be *not just a document but a scaffolded starter codebase**** her engineers can pick up on Monday morning.*

Pick: Architect — \$199/month (or \$1,910/year).

What Chen gets on top of Practitioner:

- **F8 Code DJ unlocked.** This is the engine that takes a certified MVP PDD and emits a **CODEBASE_BUNDLE** — up to 12 files plus a manifest, scaffolded against the platform of her choice (Next.js + Vercel, React + Vite, Express on Replit, Expo for mobile, or the pnpm monorepo template).
- **Unlimited** runs of F1–F7. No daily caps to worry about.
- **2 Code DJ runs per day** — designed for the reality that you don't scaffold a codebase 50 times a day; you do it once or twice, deliberately.
- A dedicated success manager.

Real-world example: Chen takes a client brief Monday morning !' runs F1–F7 to produce a certified MVP PDD by lunch !' hits F8 Code DJ !' has a starter repo to hand to her engineers by 3pm. Same day, brief to scaffold.

When to upgrade to Institution: when she has a team of 5+ all using the platform, needs on-premise deployment, needs a contractual SLA, or needs custom integrations with her own systems.

Scenario 4 — "We're a university / research lab / large company"

***Meet the team at Northwood Institute.** They want the platform deployed on their own infrastructure for compliance reasons, every researcher to have unlimited use, and a contract with proper SLAs.*

Pick: Institution (custom pricing — contact sales).

What Institution unlocks:

- Everything Architect gets, but **truly unlimited across the board** — F1 through F8.
- On-premise deployment options.
- Custom integrations (single sign-on with your existing identity provider, integration with your own document stores, etc.).
- A negotiated SLA and a named account manager.

This is the only tier that needs a conversation rather than a checkout page.

Part 2 — The Two Per-Project Credits

Subscriptions are great if you'll run lots of projects. But sometimes you only need **one** very specific

thing done very well, and a year of unlimited engine use is overkill. That's what the two per-project credits are for.

***The credits are not subscriptions.** You pay once, you get one project's worth of work, and that's it. You can buy them at any tier — even Explorer.*

	Ingestion Credit	**Advanced Cartridge**
Price	\$199.99 per project	\$499.99 per project
You bring	1 existing document (PDF, Word, or pasted text)	Up to 5 documents, prior SPCs, plus optional links to your Git repo / database
System produces	A full HARNESS session seeded by your doc, ending in a **PWDD** (PromptWare Design Document)	A full HARNESS session pre-loaded with all your context, also ending in a **PWDD / MVP PDD**
Engines unlocked for this project	F1 !' F7	F1 !' F7
F8 included?	No (needs Architect tier)	No (needs Architect tier)
Best for	"I already wrote a brief — turn it into something certified"	"I have a real project with lots of context — pull it all together properly"

A few important rules in plain English:

- **You don't need a subscription to buy a credit.** A free Explorer account can buy an Ingestion or Cartridge credit and immediately run a full F1–F7 session with it.
- **Credits don't expire.** Buy now, use whenever.
- **If something fails, you don't lose the credit.** If the system can't finish your session for any reason, the credit automatically goes back to "available" and you can try again.
- **You don't get F8 for free.** Both credits stop at F7 (the certified MVP PDD). If you also want code scaffolded, either upgrade to Architect for one month, or pass the certified document to a developer (which is exactly what it's designed for).

Scenario 5 — "I already have a one-page brief and want it turned into something proper"

***Meet Daniel.** He's pitched a product idea to two co-founders in a Google Doc. The doc is okay but it's not rigorous. He wants it pushed through the full HARNESS pipeline once and turned into a certified document. He doesn't need a subscription — this is the only project he's working on right now.*

Pick: Ingestion Credit — **\$199.99**, one-time.

How it goes for Daniel:

1. He signs up for a free Explorer account.
2. He clicks "Buy Ingestion Credit" on the pricing page and pays \$199.99.
3. He uploads his Google Doc (or pastes the text directly) on the Ingestion page.
4. The system reads the document, extracts the gist, and creates a HARNESS session **already seeded with his brief**.
5. Daniel drives that session through F1, F2, F3, F4, F5, F6, and F7 — the engine buttons are unlocked just for this one session.
6. At F7 he gets a **certified PWDD** with a public verification URL he can put in his pitch deck.

What Daniel cannot do with just the credit: open a *second* session, or run F8 Code DJ.

Why he'd pick Ingestion over Practitioner: Daniel doesn't want a \$49/month commitment. He wants one polished output for one project. \$199.99 once is the simpler choice.

Scenario 6 — "I have a real project — multiple docs, a prior spec, and an existing codebase"

Meet Esther.** She's six months into building a SaaS product. She has a 30-page product spec, three smaller design docs, two previous SPCs from earlier prompt-engineering work, a live Git repo on GitHub, and a Postgres database. She wants the HARNESS to take *all of that context**** as the starting point — not a single document, the whole picture — and produce a top-tier certified MVP PDD she can use to plan the next phase.*

Pick: Advanced Cartridge — **\$499.99**, one-time.

How it goes for Esther:

1. She opens the Cartridge wizard at [/cartridge](#).
2. **Step 1 (required):** She writes a clear scope statement — what the project is and what outcome she's after. The system enforces a minimum ("e80 characters of scope + a project name + an outcome statement) so that nobody can skip this. **This scope becomes the pinned, authoritative context that gets injected into every single engine call.**
3. **Step 2:** She uploads her 4 documents, pastes her 2 prior SPCs, and adds descriptor links to her Git repo and database (just names and URLs — no credentials are ever uploaded).
4. She pays \$499.99.
5. The system summarises each document, builds a unified context package, and creates a HARNESS session with **F1 !' F7 all pre-unlocked**
6. Every time Esther runs an engine, her scope statement and asset summaries are silently prepended to the prompt, so the engine never loses the plot.
7. At F7 she gets her certified MVP PDD — denser and more grounded than what a single-document Ingestion would have produced, because the engines were aware of her whole project.

Why she'd pick Cartridge over Ingestion: Ingestion takes one document. Esther has *eleven* artefacts plus a live codebase to consider. The Cartridge is designed exactly for projects too big for the single-doc path.

Why she'd pick Cartridge over a subscription: she's only running this one project, and she wants the pinned-scope mechanism that the Cartridge gives her. A subscription doesn't pin a scope across every call the way Cartridge does.

Part 3 — A "which one am I?" cheat sheet

Run down the list, stop at the first answer that's a clear "yes":

1. **"I just want to play with it" !'** Explorer (free). No card needed.
2. **"I have one document and want one polished certified output" !'** Ingestion Credit (\$199.99). No subscription required.
3. **"I have a complicated project — many docs, prior specs, a live codebase — and I want one premium certified output" !'** Advanced Cartridge (\$499.99). No subscription required.
4. **"I'm working on a real product and will run sessions weekly" !'** Practitioner (\$49/month, 30-day free trial).

5.

"I also want a code scaffold at the end of my sessions" !' Architect (\$199/month, 30-day free trial). Unlocks F8 Code DJ.

6. "My team / institution needs unlimited use, on-prem, and an SLA" !' Institution (call us).

Part 4 — Things people get wrong (the FAQ)

"If I buy an Ingestion Credit on a free account, do I get F8 too?"

No. F8 Code DJ is gated by the Architect subscription — credits don't unlock it. The credit unlocks F1 !' F7for that one project.

"What happens if a session crashes halfway? Do I lose my credit?"

No. Credits are refunded automatically. The system marks the credit as "available" again and you can re-run.

"Can I use one Cartridge credit to start two projects?"

No. One credit = one project = one session. If you want a second one, buy another credit (or move to a subscription if you'll do this regularly).

"Do daily limits reset at my local midnight?"

No, they reset at midnight UTC. The session-detail page shows your current count for the day.

"What's the difference between IPDD and PWDD again?"

- **IPDD = INPUT.** *Ingestion Product Design Document.* The thing **you** wrote and feed into the system (your brief, your existing spec).
- **PWDD = OUTPUT.** *PromptWare Design Document.* The thing **the HARNESS** gives you back at the end of an ingested or cartridge session — certified, with a public verification URL.

You feed it an **IPDD**; you receive a **PWDD**.

"If I cancel my subscription, do I lose access immediately?"

No. You keep paid access until the end of the period you've already paid for.

"Can I escalate a single session past my tier's caps?"

Yes — when an engine refuses to run because of tier or daily-limit caps, you can request an **escalation** for that specific session. If granted, the gate is bypassed just for that one session, so a stuck Practitioner project doesn't force a tier upgrade.

Final word

- **Don't know what you need? Start on Explorer.** It's free, and you'll learn the rhythm of F1 !' F4 inside an hour.
- **One project, one document?** Ingestion Credit.
- **One project, lots of context?** Advanced Cartridge.
- **Working on this regularly?** Practitioner.
- **Need code at the end?** Architect.
- **Whole team / institution?** Talk to us.

That's the entire pricing story in one page.
