

SPARTAN-CERTIFIED MVP-PDD · CONFIDENTIAL

ATANDA Command Centre

Minimum Viable Product — PromptWare Design Document

Codebase status assessment prepared for **investors & auditors**.

Subject system: the FORGE.BONSAI HARNESS — a PDD-blueprint instruction layer (F1-F8) behind an authenticated, Stripe-billed portal.

01 Executive Summary

ATANDA Command Centre is a production-grade subscription portal in front of the FORGE.BONSAI HARNESS — an instruction layer of ordered atomic prompts (F1-F8, plus the ATLAS J crystalliser, the PFP drift detector, and the HOST DJ side-step) that drives a deterministic prompt → SPC → PDD → certified MVP-PDD pipeline for each creator session. The MVP is feature-complete and certified at **SPARTAN Class A**: every engine ships, billing and team-seat subscriptions are live on Stripe, and the runaway-spend guardrail caps LLM cost per tier.

The platform is built contract-first on a Node.js 24 / TypeScript 5.9 pnpm monorepo (Express 5, PostgreSQL + Drizzle, Clerk auth, Claude Sonnet 4 via a managed AI proxy). It is published and operating at **command-centre-plan.replit.app** with **175 automated tests green** and an immutable engine-run ledger underpinning the cost, billing, and audit surfaces.

For auditors: the HARNESS engines are an instruction layer (a PDD-blueprint application), never SPCs themselves. The artifacts the HARNESS produces on behalf of users are the SPCs and PDDs. This document is itself an MVP-PDD drafted under that same doctrine.

02 SPARTAN Certification & Scoring

Compression was performed with the 7-step SPARTAN method — **S**can · **P**rofile · **A**ssess · **R**educe · **T**ransform · **A**udit (ZPOS+5) · **N**-package — against the source ATLAS PDD of the codebase.

Hive Matrix — 14-dimension certification

DIMENSION	SCORE	PROFILE	EVIDENCE
Functionality	9/10	■■■■■■■■■□	F1-F8 pipeline complete end-to-end; ATLAS J, PFP, HOST DJ side-steps live.
Reliability	9/10	■■■■■■■■■□	Idempotent Stripe webhooks; fail-open cost checks; cron tick exits non-zero on miss.
Security	9/10	■■■■■■■■■□	Clerk JWT verify, app-layer authz via req.localUser.id, AES-256-GCM for integration keys.
Performance	8/10	■■■■■■■■■□	Cached LLM replay suite runs ~15s; Express 5 + pooled Postgres.
Scalability	8/10	■■■■■■■■■□	Stateless API, per-seat org model, Replit-managed horizontal hosting.
Maintainability	9/10	■■■■■■■■■□	Contract-first OpenAPI + Orval codegen; one-table-per-file Drizzle schema.
Usability	8/10	■■■■■■■■■□	Portal shell with F1-F7 workspaces, exemplar library, Ascension onboarding.
Observability	8/10	■■■■■■■■■□	pino structured logging; unified activity/audit log exportable as CSV.
Compliance / Audit	9/10	■■■■■■■■■□	Immutable harness_engine_runs ledger; stripe_webhook_events idempotency PK.
Ethics / Safety	9/10	■■■■■■■■■□	PFP drift gate recomputes verdict server-side; GRO Golden-Rule overlay.
Cost Efficiency	9/10	■■■■■■■■■□	Monthly runaway-spend ceiling per tier; per-subscriber override; high-cost alerts.
Test Coverage	8/10	■■■■■■■■■□	175 automated tests green (123 api-server + 52 command-centre).

DIMENSION	SCORE	PROFILE	EVIDENCE
Documentation	9/10	■■■■■■■■■	docs/architecture features/decisions/gotchas + LLM cost guardrail.
Governance	8/10	■■■■■■■■■	Admin via Clerk role + ADMIN_EMAILS allowlist; tier gates on every engine route.

Methodology note: SPARTAN Class, IQS, GRO and the Hive Matrix are an analyst doctrinal overlay applied per SPC certification practice; they are an assessment of the codebase, not automated test output. The factual claims they summarise (test counts, middleware, schema, billing) are independently verifiable in the repository and are cited in §§04–11.

03 Product & Value Proposition

A creator runs a single coherent FORGE.BONSAI session: **F1** diagnoses a raw prompt → **F2** builds an Atomic Prompt → **F3** grows a CELL Micro Agent Birth Package → **F4** converts it to a Micro PDD → **F5** builds a full SPC → **F6** drafts a 4-part ATLAS PDD (+ VIBE DJ stack pick) → **F7** compresses to a SPARTAN-certified MVP-PDD with a public verification URL. **F8 Code DJ** (Architect+) then scaffolds a runnable codebase from the certified spec.

Terminology guardrail (IPDD vs PWDD)

IPDD = the INPUT a user already has (the Ingestion Product Design Document consumed by the Ingestion Engine). **PWDD** = the OUTPUT — a HARNESS-certified PromptWare Design Document from an ingested session. Qualified output names (Micro PDD, ATLAS PDD, MVP PDD) are unchanged.

04 The HARNESS Engines

ENGINE	NAME	FUNCTION
F1	ATLAS Diagnostic	Scores a raw prompt 0-50 JCSE across 7 pillars and extracts the 7-tuple Atomic Prompt.
F2	Atomic Prompt Certification	Certifies the human-refined 7-tuple against gold-standard rubrics.
F3	CELL Micro Agent Builder	Cultivates 8 organelles (Nucleus → Membrane) into a 5-section Birth Package.
F4	Micro PDD Converter	Emits executable build artifacts (Cheat Sheet, Worksheet, Contract) per target VIBE.
F5	SPC Builder	7-step FORGE Q&A producing the 15-section Super Prompt Card (SPC).
F6	ATLAS PDD	Drafts the 4-part product design document (Cheat Sheet, Exec Summary, Worksheet, Implementation).
F6-VDJ	VIBE DJ	Recommends the optimal stack / hosting for the PDD.
F7	MVP PDD	Compresses the ATLAS PDD via the SPARTAN method into a certified MVP-PDD with a public verification URL.
F8	Code DJ	(Architect+) Scaffolds a runnable codebase bundle (≤12 files + manifest) for the chosen platform.
ATLAS J	JSON Crystalliser	Converts Markdown ATLAS PDDs into typed JSON views with stable Prompt IDs.
PFP	PDD Fidelity Protocol	BUGMXT-L4 drift detector auditing F8 code against the F7 spec on a 7-code taxonomy.
H0ST DJ	Hosting Side-step	Advisory hosting / platform selection; server-recomputed HSE ranking; never an SPC.

05 Feature Surface

- **Organizations & team seats** — multi-tenant owner/admin/member roles; team and team_lite plans confer an effective tier to every member.
- **Notifications** — weekly digests (7-day rollup), billing-failure alerts, high-cost run alerts (default > \$1/run).
- **Sphinx Marketplace** — outbound publishing of F5 SPCs to Ark.Onecraft via AES-256-GCM-encrypted keys.
- **Activity / audit log** — unified engine-run + billing view, filterable, CSV-exportable.
- **Advanced Cartridge** — \$499.99 premium path; a 24KB authoritative context layer pre-injected into every engine run.
- **Ingestion** — per-project billing to seed a session from an existing IPDD.
- **Senior badges** — AISA·PWDD (≥ 3 PWDD-stage projects) and AISE·BUILD (verified live build evidence).
- **Context Craft mini-quests** — auto-awarded pillar badges on JCSE sub-scores ≥ 6 .
- **Ascension Protocol** — 13-rung onboarding tied to The Atomic Prompt; rungs proven by real signals, never self-reported.

06 Architecture & Stack

- **Runtime** — Node.js 24, pnpm workspaces, TypeScript 5.9.
- **API** — Express 5, contract-first OpenAPI 3 + Orval codegen, pino logging.
- **Database** — PostgreSQL + Drizzle ORM; app-layer authorization via `req.localUser.id` (no RLS).
- **Auth** — Clerk (Replit-managed), JIT-synced to local users + subscribers.
- **LLM** — Claude Sonnet 4 via a managed Anthropic AI proxy with a provider-switching abstraction.
- **Validation** — Zod (operationId-shaped generated schemas), drizzle-zod.
- **Build** — esbuild CJS bundle.

Core tables include `users`, `command_centre_subscribers`, `organizations`, `harness_sessions`, `harness_artifacts`, `harness_engine_runs`, `cartridge_packages`, `ingestion_credits`, `context_craft_badges`, `integration_credentials`, and `stripe_webhook_events`.

07 Security & Authorization

- **Authentication** — Clerk verifies JWTs; `requireAuth` attaches `req.localUser`, `req.subscriber`, and `req.effectiveTier`.
- **Authorization** — app-layer; engines gate on `requireTier`, orgs on membership checks.
- **Admin** — Clerk `publicMetadata.role === "admin"` or email in `ADMIN_EMAILS`.
- **Secrets** — integration keys (Sphinx / GitHub) stored AES-256-GCM encrypted.
- **Webhook safety** — Clerk proxy mounts before body parsers; Stripe webhook raw-body & idempotent on `event_id`.

08 Monetization & Billing

TIER / SKU	PRICE	INCLUDES	COST CAP
EXPLORER	\$0	Throttled F1-F7, F8 disabled	\$2 / mo
PRACTITIONER	\$49 / mo	F1-F7 active	\$50 / mo
ARCHITECT	\$199 / mo	Unlimited F1-F7, 2× F8 / day	\$250 / mo
INSTITUTION	~\$149 / seat	Per-seat teams, unlimited F8	\$2,000 / mo
Cartridge	\$499.99 once	Premium multi-doc context injection	—
Ingestion	per project	Seed a session from an existing IPDD	—

Stripe drives subscriptions and one-time purchases. Per-seat team/team_lite plans propagate an effective tier to org members. Webhook events are persisted idempotently; a throwing handler rolls back its idempotency row so Stripe can legitimately retry.

09 Cost Guardrail

Every engine route mounts `requireCostBudget` after `rateLimit`. The guard runs a live SUM over `harness_engine_runs.cost_usd` for the current UTC month and returns `402 COST_CAP_EXCEEDED` when the tier ceiling is hit. Caps are configurable per tier, overridable per subscriber, and support optional grandfathering of legacy caps by cutoff date. The next target is the **10% Rule** guardrail. The check is fail-open: a database error lets the request through to avoid lockouts.

10 Quality, Testing & Operations

- **175 automated tests green** — 123 api-server + 52 command-centre (Vitest).
- **Deterministic LLM suite** — 30 provider-switching tests replay cached fixtures (~15s, no network); a nightly GitHub Action refreshes fixtures live and opens a drift issue on change.
- **Drift gate** — PFP recomputes counts and verdict server-side before persisting, so the model's self-reported numbers cannot bypass the F8 gate.
- **Scheduled jobs** — weekly digest (Mon 09:00 UTC) and harness-limit reset (daily 00:00 UTC) via external cron ticks that exit non-zero on failure so a missed tick surfaces in deployment logs.

11 Risk Register

RISK	LIKELIHOOD	IMPACT	MITIGATION
LLM cost runaway	Med	High	Per-tier monthly ceiling (live SUM over harness_engine_runs), per-subscriber override, high-cost alerts, 10% Rule roadmap.
Provider / model dependency	Med	Med	Provider-switching abstraction (anthropic integration pkg); nightly cross-provider fixture diff guards regressions.
Spec ↔ code drift (F8)	Med	High	PFP recomputes counts & verdict server-side before persisting; drift gate blocks bypass of contradictory output.
Billing webhook loss / replay	Low	High	Idempotent handler keyed on event_id; failed handlers roll back the idempotency row so Stripe retries safely.
Onboarding inflation	Low	Med	Ascension rungs proven by real signals (badges, runs, artifacts), never self-reported.

12 Evolution Roadmap

HORIZON	FOCUS
Now — MVP certified	F1-F8 pipeline, billing, orgs, badges, ingestion, cartridge shipped and tested.
Q3 2026	10% Rule cost-guardrail target; expand provider matrix; Sphinx marketplace GA.
Q4 2026	Team analytics, seat-level cost dashboards, SSO hardening.
Q1 2027	PWDD lineage graph, public verification registry, audit export API.
Q2 2027	Self-serve cartridge authoring, partner VIBE adapters.
H2 2027	Enterprise compliance pack (SOC2 path), regional hosting controls.

13 Governance, Lineage & Signature

Certifier: ATANDA Command Centre — FORGE.BONSAI HARNESS (F7 SPARTAN method). **Maintainer:** Platform engineering. **Escalation:** admin allowlist (ADMIN_EMAILS).

Lineage: source ATLAS PDD ← F6 of the live codebase status session; upstream SPC ← F5; diagnostic ← F1. Source corpus = the project repository and docs/architecture/ at 2026-06-01.
